

*"Connecting Minds,
Calming Hearts"*

AI CHATBOT: Medi-AI

Medi-AI

BACKGROUND

Mental health disorders affect around 1.1 billion people globally, with 75% in low-income countries receiving no treatment. The COVID-19 pandemic and abuse triggered the increase in mental health issues worldwide. Traditional mental health care faces barriers like high cost, long waiting times, limited geographical access and social stigma.

FEATURES

- Asks users relevant lifestyle and mental health questions.
- Processes their responses into structured input.
- Predicts depression risk using the trained Random Forest model.
- Provides feedback: either reassurance and self-care tips (for "No Depression") or referral advice (for "Depression").

OBJECTIVES

- Provide a low-cost AI chat-bot for early depression screening that is available 24/7 to individuals who cannot afford traditional therapy.
- Reduce the number of non-critical visits to healthcare facilities.
- Improve early intervention rates through accessible AI-driven support by identifying users at high-risk of severe distress or crisis and successfully refer them to human resources.
- Achieve a measurable reduction and symptoms of common mental health issues like anxiety and depression among consistent users; which empower individuals to manage mental well-being through personalized advice.
- Offer anonymous support to reduce stigma barriers
